

# Sorting

Saturday, February 17, 2018 1:09 AM

- Sort Key
- Best/ worst/ average case bounds
- In-place sort:  $O(1)$  extra space during sorting
- Stable sort: relative order of elements with same key value preserved
- Algorithms can be combined for the best result

## Applications

- Uniqueness testing, deleting duplicates, frequency count, set notation, searching (efficiently), dictionary/ directory

## Comparison-based

| Iterative  | Recursive   |
|--|---|
|  | Divide-and-conquer: recursively solve   |
| <b>Selection Sort</b> <ul style="list-style-type: none"><li>• Find largest -&gt; put at back</li><li>• <math>O(n^2)</math></li></ul>   | <b>Merge Sort</b> <ul style="list-style-type: none"><li>• Most of the work done in merge() step</li><li>• merge() called <math>\log n</math> times, each step =</li><li>• Additional temporary arrays needed, inputs have to be copied to original array</li></ul>  |
| <b>Bubble Sort</b> <ul style="list-style-type: none"><li>• Need to swap <math>i</math>th and <math>i+1</math>th items?</li><li>• <math>O(n^2)</math>, even for sorted input<ul style="list-style-type: none"><li>◦ Improvement: flag to check if input is sorted</li><li>◦ Mark out which portions are already sorted</li></ul></li><li>• Best case = <math>O(n)</math>, for outer iteration</li></ul> | <b>Quick Sort</b> <ul style="list-style-type: none"><li>• Pivot <math>p</math>, split data into 2 parts recursively</li><li>• Pivot is randomly selected</li><li>• Most of the work done in divide step</li><li>• In-place sorting (only swapping operations)</li><li>• Complexity = <math>O(n)</math> per partition</li><li>• Best case = depth <math>\log n</math>, <math>O(n \log n)</math></li><li>• Worst case = already sorted; <math>O(n^2)</math><ul style="list-style-type: none"><li>◦ What if order is reversed?</li></ul></li></ul> |
| <b>Insertion Sort</b> <ul style="list-style-type: none"><li>• Scan backwards and insert</li><li>• Best case = <math>O(n)</math>, worst case = <math>O(n^2)</math></li></ul>  |   |

## Non-comparison based

- Radix Sort and Heap Sort

### Radix Sort

- "radix" refers to position of decimal points
- Each data is a character string
- $O(d*n)$ ;  $d$  = number of possible characters
  - Worst case,  $d$  is  $\log n$ , hence  $O(n \log n)$
  - $d$  can be fixed or bounded to give  $O(n)**$  (usually the case)
- Last digit > second last > .... > first digit

# Summary of Sorting Algorithms

|  | Worst Case    | Best Case     | In-place? | Stable? |
|--|---------------|---------------|-----------|---------|
| <b>Selection Sort</b>                        | $O(n^2)$      | $O(n^2)$      | Yes       | No      |
| <b>Insertion Sort</b>                        | $O(n^2)$      | $O(n)$        | Yes       | Yes     |
| <b>Bubble Sort</b>                           | $O(n^2)$      | $O(n^2)$      | Yes       | Yes     |
| <b>Bubble Sort 2</b><br>(improved with flag) | $O(n^2)$      | $O(n)$        | Yes       | Yes     |
| <b>Merge Sort</b>                            | $O(n \log n)$ | $O(n \log n)$ | No        | Yes     |
| <b>Radix Sort</b><br>(non-comparison based)  | $O(n)$        | $O(n)$        | No        | yes     |
| <b>Quick Sort</b>                            | $O(n^2)$      | $O(n \log n)$ | Yes       | No      |

**Notes:** 1.  $O(n)$  for Radix Sort is due to non-comparison based sorting.  
2.  $O(n \log n)$  is the best possible for comparison based sorting.

55

## Java API

- `Array.sort()`
- `Collections.sort(list)` // for list
- Non-primitive data: apply a comparator
